How to Merge a Bar Code with a Text File using Filemaster

1. Export your data file from your database (or whatever program you are exporting **from**) as **tab** or **return** separated text. You should then have a plain text file.
2. Launch Filemaster
3. Select your label (or envelope) template from the template list.

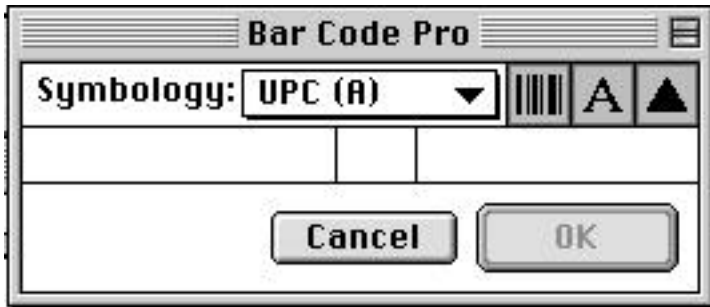

Next, go to **Templates** in your menu and select **Link**. You will then see the **Link Info** dialog box appear. You will also see the first record of your export file and all of the fields within it. See the example below.

Label Template Link Info window

4. Add the fields you want on your template (see pages 78 and 79 of your manual for more information on selecting and placing fields).

To add a field and link (merge) it with a bar code, simply select **Insert as new: Bar Code**. Bar Code Pro will then appear on screen.

If you are not using **Code 39**, simply select the symbology you want to use.

When you print, you will see all of the the selected fields and the bar code which has been linked.

Be sure to refer to your user's manual and practice the steps. You've purchased a powerful tool and you're asking to do procedures that can be complex. Practice the steps, and you'll become fluent in no time.
